

Chloramine is poison: what's REALLY in your taps

If you live anywhere in the greater Wellington region, your council has probably already switched your water to chloramine without telling you. They always do it quietly.

Chloramine is ammonia mixed with chlorine. It is far more toxic than chlorine alone, and unlike chlorine it does not evaporate when you boil the water-meaning every glass of water, every batch of pasta, every baby's formula carries it straight into your family. Studies (the ones the water companies don't cite) have linked chloramine to skin rashes, digestive problems, and damage to the lining of the gut. Vets have reported a sharp rise in itchy-skin complaints in dogs in treated areas.

Why won't they use the safer option? Follow the money: chloramine is cheaper, and that is the only reason.

What you can do today:

1. Stop drinking unfiltered tap water. Boiling does NOT remove chloramine (only our catalytic carbon does-see our tested filter range below).
2. Give pets filtered or bottled water only. Their skin and coat will tell the difference within weeks.
3. Bathe children in filtered water where possible; chloramine vapourises in a hot shower and you inhale it.
4. Ask your council directly whether YOUR suburb is dosed-they rely on you not asking.
